Remote Pipeline Update

When installing Remote Pipeline, please read the installation in the manual carefully when performing the installation. We have included an updated Remote Pipeline executable and you need to replace the existing one created from the installation program with the new one on this CD (rpl1.rxe). The changes repair one bug and also included a new feature called TRANSALL. Normally TRANSALL is not used for normal operation, but it can help if there is an interruption in data transfer due to a network problem. We have included the TRANSALL application note on this CD.

If you have any other installations of Remote Pipeline 1.2, be sure to replace the rpl1.exe file with the one on this CD.
